

## A wide range of pipe fittings: Individuality is our strength

BUTTING supplies not only longitudinally welded pipes but also the necessary fittings for piping construction. We have more than 3,500 fittings in standard sizes available in store for our customers.

Our strength lies particularly in the order-related manufacturing of fittings from special materials and in special sizes.

We are thus in a position to supply our customers with all the required parts for their piping systems from a single source – starting with the pipe, and including elbows, tees and reducers, saddles or shoe branches.

As part of its comprehensive prefabrication facilities, BUTTING can assemble the individual elements into ready-to-install piping components in our plant. As our customer, you can benefit from a high degree of cost-effectiveness and the optimum quality of the end product installed.

An example of our competence and experience in this area of special pipe fittings and parts are special tees manufactured to the customer order. They are used in compensators for waste gas systems. These are manufactured using a parent pipe and a branch pipe, both of which are formed via our specially developed tools and then welded in a special process. Then there is 3-sided mechanical processing on the milling machine in a clamping operation.

Another proof of our know-how are special elbows, e. g. made of material 1.4435. These have been manufactured from us regularly for around 20 years or so for the aerospace industry. They are then built into the EPC stage of Ariane 5, for example, as semi-finished products.

Pipe + pipe fittings + prefabrication = your ready-to-install BUTTING piping component

This calculation will add up for you too!
